OPENING AND CLOSING DRAIN PLUGS

For controlled removal and tightening of container plugs, Sæplast recommends the dedicated manual plug key. Use the examples below as a quick reference for correct handling.

4-step operating guide

1 PREPARE THE CONTAINER

Place the container securely. Clear dirt, ice or residue from around the plug before opening.

2 ENGAGE THE PLUG KEY

Fit the Sæplast key fully into the plug. Make sure it is seated squarely before applying force.

3 OPEN THE PLUG

Turn counter-clockwise with steady pressure to loosen. Remove carefully and allow controlled draining.

4 REFIT AND TIGHTEN

Clean the sealing surfaces, refit by hand, then turn clockwise with the key until secure. Do not overtighten.

IMPORTANT

- Use the dedicated Sæplast plug key rather than improvised tools or extensions.
- Do not open a plug where the contents could discharge unsafely or where drainage is not permitted.
- Inspect the plug and sealing components before reuse. Replace damaged parts before returning the container to service.
